Trigonometry – is a mathematical technique used to calculate angles and side lengths of right triangles.

Defining Sides of a Right Triangle

Given an 'angle of interest' in a right triangle, the three sides of the triangle can be labeled as

- **Hypotenuse – across from the right angle.**
- **Opposite – on the opposite side of the triangle.**
- **Adjacent - beside the angle of interest.**

Ex. 1 – Label the three sides of the each triangle as opposite, adjacent and hypotenuse relative to the 'angle of interest' Θ.

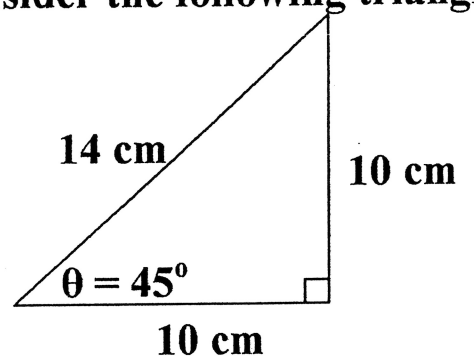
Introducing the Tangent Function

For any right triangle,

$$\tan\theta = \frac{opposite}{adjacent}$$

Ex. 2 - Consider the following triangle:



a) Label the sides of this right triangle; hypotenuse, opposite, adjacent.
b) Calculate the tangent of angle θ using two methods.

Ex. 3 – Compute the tangent of θ in each diagram.

Ex. 4 – Use the tan function to determine the length of the unknown side length x.
