

## Solving Linear Systems Using Elimination: Part 2

### Warm-Up

Solve the following linear systems using an efficient technique.

a)  $\begin{array}{l} \textcircled{1} \quad 3x + y = -2 \\ \textcircled{2} \quad 2x - 3y = 17 \end{array}$

*Isolate y in  $\textcircled{1}$*   
 $y = (-2 - 3x)$  new  $\textcircled{1}$   
 Sub  $\textcircled{3}$  into  $\textcircled{2}$   
 $2x - 3(-2 - 3x) = 17$   
 $2x + 6 + 9x = 17$   
 $11x + 6 = 17$   
 $11x = 17 - 6$

$\rightarrow \frac{11x}{11} = \frac{11}{11}$   
 $\textcircled{4} \quad x = 1$   
 Sub  $\textcircled{4}$  into  $\textcircled{3}$   
 $y = -2 - 3(1)$   
 $y = -2 - 3$   
 $y = -5$   
 $\therefore \text{The P.O.I. is } (1, -5)$

b)  $\begin{array}{l} \textcircled{1} \quad 2x + 3y = 11 \\ \textcircled{2} \quad 4x - 3y = -5 \end{array}$

$\textcircled{1} + \textcircled{2} \quad \frac{6x}{6} = \frac{6}{6}$   
 $\textcircled{3} \quad x = 1$   
 Sub  $\textcircled{3}$  into  $\textcircled{1}$   
 $2(1) + 3y = 11$   
 $2 + 3y = 11$   
 $3y = 11 - 2$   
 $\frac{3y}{3} = \frac{9}{3}$   
 $y = 3$

### Elimination

In many instances, linear equations need to be multiplied by a constant so that the elimination technique can be applied.

### Examples

Solve each linear system using elimination.

a)  $\begin{array}{l} \textcircled{1} \quad 2x + 4y = 20 \\ \textcircled{2} \quad 3x - 2y = -18 \end{array}$

$3x\textcircled{1} = \textcircled{3} \quad 6x + 12y = 60$   
 $2x\textcircled{2} = \textcircled{4} \quad 6x - 4y = -36$   
 $\textcircled{3} - \textcircled{4} \quad \frac{16y}{16} = \frac{96}{16}$

$\textcircled{5} \quad y = 6$   
 Sub  $\textcircled{5}$  into  $\textcircled{1}$

$2x + 4(6) = 20$

$2x + 24 = 20$

$2x = 20 - 24$

$\frac{2x}{2} = \frac{-4}{2}$   
 $x = -2$

b)  $\begin{array}{l} \textcircled{1} \quad 5x - 2y = 22 \\ \textcircled{2} \quad 2x + 6y = 2 \end{array}$

$6x\textcircled{1} = \textcircled{3} \quad 30x - 12y = 132$   
 $-2x\textcircled{2} = \textcircled{4} \quad -4x - 12y = -4$   
 $\textcircled{3} - \textcircled{4} \quad \frac{34x}{34} = \frac{136}{34}$

$\textcircled{5} \quad x = 4$   
 Sub  $\textcircled{5}$  into  $\textcircled{2}$

$2(4) + 6y = 2$

$8 + 6y = 2$

$6y = 2 - 8$

$\frac{6y}{6} = \frac{-6}{6}$

$y = -1$

$(30x) - (-4x)$   
 $= 30x + 4x$   
 $= 34x$

$(-12y) - (-12y)$   
 $= -12y + 12y$   
 $= 0y$

$\therefore \text{The P.O.I. is } (4, -1)$

## Practice

Solve each linear system using the elimination technique.

a)  $2x + 4y = -2$

$3x + 4y = 1$

\* b)  $3x + 2y = 2$

$2x + 3y = 8$

\* c)  $x - 2y = 10$

$2x + 5y = 2$

\* d)  $5x + 2y = 0$

$3x - 3y = 21$

Answers:

a) (3, -2)

b) (-2, 4)

c) (6, -2)

d) (2, -5)
